

## CUB SCOUT PUSH CART PLANS

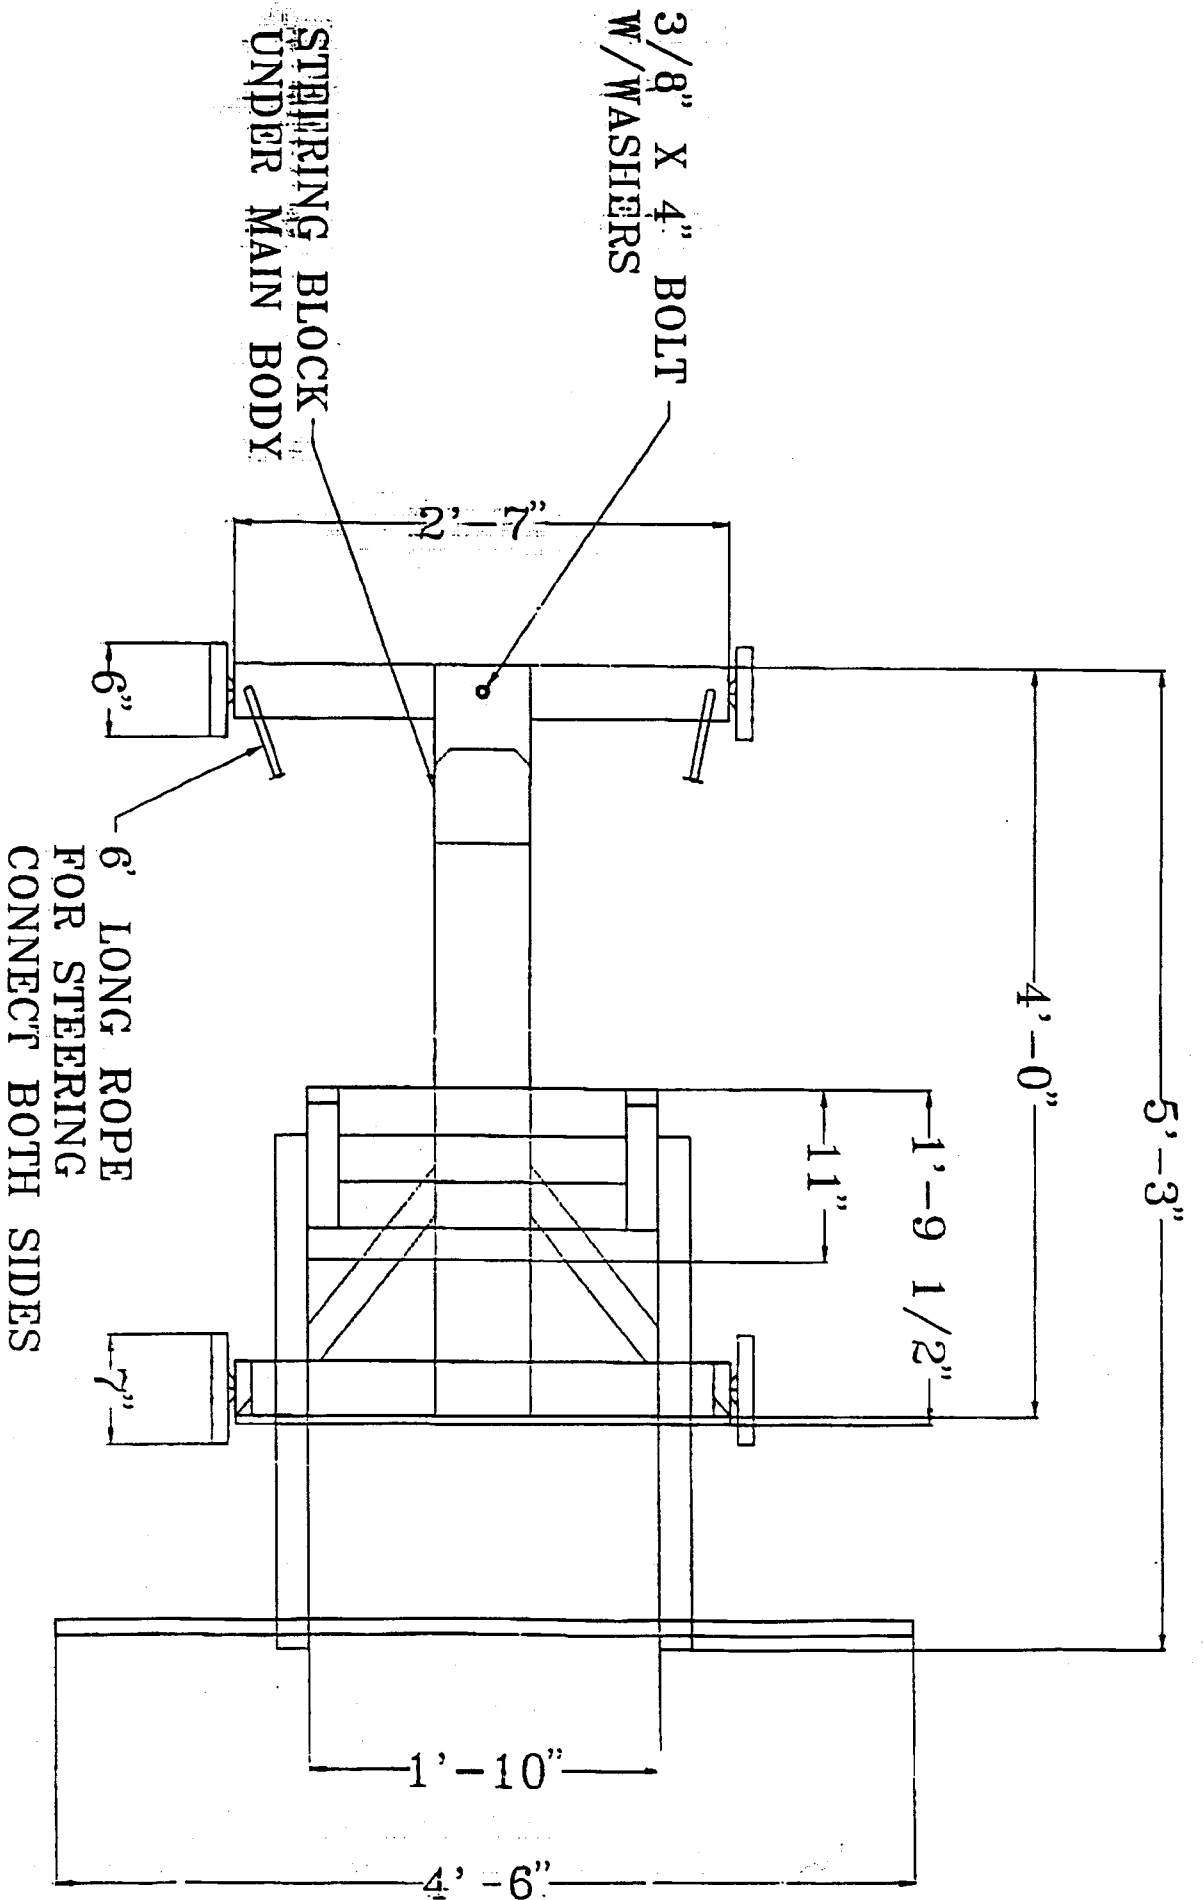

Since our last push cart race, we have come up with a minor modification to the push cart. Some of the drivers were losing their balance and were taking their feet off the steering bar to catch themselves. As a result, they were losing control and getting their feet stuck underneath the cart or falling out completely. It may become necessary to install a 2 X 4 foot rest on top of the main body at a location near the steering block. If the boys can keep their feet stationary on the foot rest and only steer by pulling on the rope, we can eliminate the possibility of injuries.

There is no right or wrong way to build the push cart. Customize it to fit your own pack's size or needs but any adjustments or changes should be done with safety in mind. Most of all HAVE FUN!

This push cart was designed and built by the parents of Pack 207 San Jose, Ca. It has not been engineered or tested for any design or operational defects. It is intended for scout functions only and not to be used without direct parental supervision. Neither Pack 207 or the Santa Clara County Council assumes any liability for any design defects or any accidents that may result from the use of these blueprints.
